SOFT METAL DISC

Gemtex's Resin Fiber disc is designed for soft metals like aluminum. It is ideal for cases where the disc wears out before the abrasive on the disc. The resin softens the small pieces being abraded, so they melt and stick to the face of the disc. The metal pieces fill in the grain, slowing down the abrading process and preventing the disc from being used.

The use of resin additives which act as lubricants will extend disc life by preventing metal particles from the disc. It is as if a thin layer of grease is applied to the work surfaces in order to prevent metal particles from sticking to the disc. The temperature of the work surface is kept lower and melting is delayed, allowing the disc to last longer between regrinds.

It is important to note that the use of resin additives is not recommended for all applications. It is not recommended for use on hard materials or for applications where a high degree of finish is required. The use of resin additives is not recommended for use on hard materials or for applications where a high degree of finish is required.
